

Thank you Kate for sharing your presentation. It is so impressive and really like how the artefact could immediately support society and support mitigation of emotional distress that could result from cyberbullying. With an interest in machine learning algorithms, was there any selection process for the ones chosen and did the selected algorithms support your findings as intended?

Thank you Zihaad for sharing your presentation. I was really engaged in reading the findings presented; they were very impressive. As the conclusions reached that service providers should implement TLS and SRTP, are there any challenges for implementation, and if yes, can these be overcome quickly, or would significant changes be made to current practices?

Thank you Sherelle, for an exciting and insightful presentation, particularly with society targeted by phishing attempts; the game will be an interactive strategy to enhance awareness. With the sophistication and levels of deception in phishing attacks, would the participants feel they were equipped to use the awareness gained in real life and were considerations made on the email cards for participants of different abilities and levels of prior knowledge?
